Verwendung des Let'sEncrypt Client für eine neue Domain

Pro Zertifikat können mehrere Domains/Subdomains integriert werden. Diese müssen in der domains.txt in einer Zeile stehen.

1. Let's Encrypt ACME-Challenge-Verifikation im VHost aktivieren

   /etc/nginx/sites-available/example.org

   ```
   server {
     ...
     include snippets/letsencrypt.conf;
     ...
   }
   ```

2. Domain eintragen und Zertifikat erzeugen

   /home/letsencrypt/letsencrypt.sh/domains.txt

   ```
   example.org www.example.org
   ```

   - ***su - letsencrypt***
   - ***cd letsencrypt.sh***
   - ***./letsencrypt.sh -c***
3. Verbindung als Nutzer beenden
   - ***exit***
4. DH-Parameter erstellen
   - ***mkdir /etc/ssl/example.org***
   - ***openssl dhparam -out /etc/ssl/example.org/dhparam.pem 4096***
5. SSL mit HSTS aktivieren und SSL-Zertifikate im NGINX einbinden

   /etc/nginx/sites-available/example.org

   ```
   server {
     ...
     ssl on;

     ssl_session_cache shared:SSL:10m;
     ssl_session_timeout 10m;

     ssl_prefer_server_ciphers on;

# Edit this file to introduce tasks to be run by cron.

# Each task to run has to be defined through a single line

#
# To define the time you can provide concrete values for
# minute (m), hour (h), day of month (dom), month (mon),
# and day of week (dow) or use '*' in these fields (for 'any').#
# Notice that tasks will be started based on the cron's system

# Output of the crontab jobs (including errors) is sent through
# email to the user the crontab file belongs to (unless redirected).
#
# For example, you can run a backup of all your user accounts
# at 5 a.m every week with:
# 0 5 * * 1 tar -zcf /var/backups/home.tgz /home/

# For more information see the manual pages of crontab(5) and cron(8)

- ***cd /usr/bin/***
- ***ln -s nodejs node***

Plugin-Installation

- ***sudo -u etherpad /bin/bash***
- ***cd ~/etherpad/***
- ***npm install ep_pad-lister***

Konfiguration

~/etherpad/settings.json

```
{
...
